The exp 12 C(p,2p) exp 11 B reaction has been measured at 100 MeV in both symmetric and asymmetric geometries. Distorted Wave Impulse Approximation calculations were used to obtain spectroscopic factors for all states of exp 11 B below 7 MeV excitation. From the spectroscopic factors and the shapes of the measured angular correlations, it is concluded that (1) no large 1f-components are present in the wavefunction of the ground state of exp 12 C, and (2) this experiment gives no evidence for the formation of giant resonances as the intermediate step in multi-step reaction processes to the 4.44 MeV (5/2 exp -) and 6.74 MeV (7/2 exp -) states of exp 11 B. A partial wave analysis of the differential cross sections for the exp 18 O(p, alpha sub 0) exp 15 N reaction has been carried out applying the formalism of Blatt and Biedenharn (1952), made specific for this reaction. The differential cross sections, measured at 200 keV intervals from 6.6 to 10.4 MeV bombarding energy, were subjected to least-squares fitting to this specific analytic expression. Two resonances were given by the analysis, the exp 19 F states being at 14.71+-0.07 MeV (1/2 exp -) and 14.80 + 0.07 MeV (1/2) exp + . (Atomindex citation 12:603995)

M. R. Anderson, S. R. Kennett, Z. E. Switkowski, and D. G. Sargood. 1979, 176p
U.S. Sales Only.

The yield of 1.332 MeV gamma -rays from the reaction exp 56 Fe (alpha , gamma) exp 60 Ni has been measured as a function of alpha -particle bombarding energy in the range 4.2 - 7.1 MeV. This energy region includes the (alpha ,n) threshold at Esub(alpha) = 5.46 MeV. The energy dependence of this gamma -ray cross section, as well as the (alpha , n gamma) cross section is compared with statistical model calculations. Good agreement is achieved between these data and calculations using global optical model parameters to determine the transmission functions. In particular, the pronounced threshold effect in the (alpha , gamma) yield, at the opening of the (alpha , n) channel, is well represented. (Atomindex citation 12:603996)

The yields of gamma rays from the reactions exp 50 Ti(p, gamma) exp 51 V and exp 50 Ti(p,p' gamma) exp 50 Ti have been measured as a function of bombarding energy over the range 0.73 - 4.39 MeV and the yield of neutrons from the reaction exp 50 Ti(p,n) exp 50 V has been measured from threshold to a bombarding energy of 4.39 MeV. Competition effects were observed in the gamma -ray yields from the (p, gamma) and (p,p' gamma) reactions at the threshold of the (p,n) reaction. The observed yields in all channels were lower by factors of order 3 than those predicted by statistical model calculations based on global optical parameters and the competition observed in the (p, gamma) yield at the opening of the neutron channel was approximately one half that predicted by the statistical model calculations. These failures of the calculations are tentatively attributed to the neutron closed shell nature of exp 50 Ti. Thermonuclear reaction rates for the (p, gamma) and (p,n) reactions are calculated. Oscillation and Mixing of Massless Electron and Muon Neutrinos.

It is not necessary that the electron neutrino and muon neutrino themselves have mass for oscillations to occur. For N neutrinos, if one is massive, oscillations occur with unique oscillation length determined by the mass of the heavy neutrino, mimicing two neutrino mixing. Any observation of oscillations cannot therefore be regarded as evidence for a finite mass electron neutrino or muon neutrino. (Atomindex citation 12:603760)

These results for exp 108 Pd, when taken in conjunction with those of prior similar measurements for exp 106 Pd at lower velocities, and fitted to a velocity dependence for the EDF, give for the Pd isotopes over the extended velocity range 1.74<=(v/v sub 0)<=7.02, p=0.41+-0.15; a result incompatible with previous attributions of a linear velocity dependence for the field. The lifetimes and lifetime limits of the low-lying excited states up to and including the 6 sub 1+ levels in exp 196 exp 198 Pt were determined by the rcoil-distance method (RDM). Gamma-ray angular distributions in exp 198 Pt were also measured. These states were populated by multiple Coulomb excitation using 220-MeV exp 58 Ni ion beams and the measurements carried out in coincidence with backscattered projectiles. The measured mean lives of the states and B(E2) values inferred for the transitions between levels are presented. These specific findings, and the observed structure systematics obtained from the combination of the present results and those of prior workers for the even exp 194 - exp 198 Pt isotopes, are critically compared with our structure calculations employing the Interacting Boson Approximation (IBA) model incorporating a symmetry-breaking quadrupole force. The enhanced transient: hyperfine field manifest at the nuclei of swiftly recoiling ions traversing magnetized ferromagnetic materials was utilized to measure the gyromagnetic ratios of the 2 sub 1+ , 2 sub 2+ and 4 sub 1+ states in exp 198 Pt by the thin-foil technique. The states of interest were populated by Coulomb excitation using a beam of 220-MeV exp 58 Ni ions. In addition, these measurements served to discriminate between the otherwise essentially equally probable values previously reported for the E2/M1 ratio of the 2 sub 2+ -2 sub 1+ transition in exp 198 Pt. Interacting Boson Approximation (IBA) model-based calculations were also performed in the O(6) limit symmetry, with and without inclusion of a small degree of symmetry breaking, and employed the M1 operator in both first - and second-order to obtain M1 selection rules and to calculate gyromagnetic ratios of levels. The gyromagnetic ratio of the 3 sub 1+ state (937-keV excitation energy) in exp 18 F was measured by the time-integral IMPAC technique following implantation in a magnetically saturated Fe foil. The exp 16 O(exp 3 He,p gamma) reaction was employed using 3.75-MeV exp 3 He exp + beams. Measurements of the angular distribution of the de-excitation gamma ray from this level to the ground state and of its precession in the hyperfine field were carried out in coincidence with backward-emitted reaction protons. The sign and magnitude determined for the g-factor of this state is g = +0.54+-0.06. Shell-model calculations of the g-factor of this level have been performed and are evaluatively compared with experiment. (Atomindex citation 12:604010)

A left-right symmetric gauge theory of electroweak interactions is considered in which only one Higgs field and its charge conjugate couple to quarks. Among all possible parity transformations those allowing for phenomenologically acceptable mass matrices are singled out. In such a theory arbitrary horizontal symmetry groups with unitary representations are investigated. Both for two and three quark generations essentially only one model emerges which is compatible with empirical constraints on quark masses and mixing angles. (Atomindex citation 12:576821)

Matrix Elements and Decays of Baryons in a Bethe-Salpeter Model with Strong Binding.
P. Falkensteiner. 1980, 19p

U.S. Sales Only.

The experimental consequences of a Bethe-Salpeter model of the baryons proposed by Kielanowski are studied in detail. The model gives good results for the electromagnetic and weak form factors of baryons. When combined with the meson model of Boehm, Joos and Krammer the model gives reasonable values for the strong decay width of baryon resonances. For the S-wave amplitudes of nonleptonic decays the author obtains values with the help of a phenomenological quark-pion vertex. (Atomindex citation 12:576822)

Level Shifts and Inelastic Electron Scattering in Dense Plasmas.
Memorandum rept.,
J. Davis, and M. Blaha. 10 Dec 81, 35p Rept no. NRL-MR-4689

A completely quantum mechanical formalism has been developed to describe the high density plasma effects on fundamental atomic parameters. Both the bound and free electrons are treated by a method which in principle is similar to Hartree's self-consistent field method. The free plasma electrons' wave-function is obtained from the Schrodinger equation with the effective potential representing the spherically averaged Coulomb interaction with bound and free electrons. Results are given for level shifts, coefficients of transition probabilities, and electron collision cross sections of Ne(9+) for temperature and 200 and 500 e V for an electron density range of 1 - 6 x 10 to the 24th power/cc, and of Ar(17+) for temperatures of 1000 and 2000 eV and electron densities from 2 x 10 to the 25th power to 8 x 10 to the 25th power/cc. In the low-density region, level shifts are obtained for H and He+. (Author)

The production of entropy and phenomenological relations in a thermally unstable plasma are discussed. Evolution of the plasma electric potential is described macroscopically. A metallic surface in the presence of heat transfer and electrical conduction is depicted one dimensionally. A system of difference equations was solved. Expressions for the characteristic equation near equilibrium and for the specific rates of adsorption and desorption in function of electron density, electron energy, and plasma flow are given. The significance of the coefficients of diffusion is pointed out.

A plasma generation theory is elaborated which is based on surface wave propagation characteristics and the hypothesis that the energy absorbed from the wave is proportional to the number of electrons in the plasma, the proportionality factor being independent of the power. Experimentally, the validity of this hypothesis was verified in a rare gas cavity resonator. Direct application of this model makes possible calculation of the effective collision frequency for each experimental condition (excitation frequency). From the collision rate, the mean electron temperature is deduced, assuming a Maxwell distribution. An approximation of losses in the plasma is obtained.

Calculations of the photoabsorption and photoyield of small metal spheres are reported for photon energies below the plasmon energy. It is found that the excitation of electron-hole pairs due to the presence of the surface results in (1) enhancements in the photoabsorption rates and photoyields that are typically 10-100 and (2) similar enhancements in the threshold photoyields of small spheres relative to plane surfaces in agreement with recent exprimental results.

As a check case for numerical studies of tensile cracking in nonlinear media, closed form solutions have been derived for the following problems. A finite slab of bilinear material is loaded on one face by a sharp-fronted triangular pressure pulse. Cracks are assumed to form in the first case when the stress exceeds a tensile limit for a finite time, i.e., the tensile impulse is finite. In both cases the stress reaches the tensile limit and a first crack forms shortly after the incident wavefront reflects from the free face of the slab. In the first case a continuously cracked zone develops under the action of a tensile spike caused by the first crack. In the second case, the tensile spike has no effect on cracking, and a sequence of discrete cracks form. Stress histories and stress profiles are plotted for both cases. (Author)

Presented at the Ideele Traeger der Surtec Berlin '81, West Germany, 29 Jun. - 3 Jul. 1981.

Results are presented for the use of surface analytical tools including field ion microscopy, Auger emission spectroscopy analysis (AES), cylindrical mirror Auger analysis and X-ray photoelectron spectroscopy (XPS). Data from the field ion microscope reveal adhesive transfer (wear) at the atomic level with the formation of surface compounds not found in the bulk, and AES reveals that this transfer will occur even in the presence of surface oxides. Both AES and XPS reveal that in abrasive wear with silicon carbide and diamond contacting the transition metals, the surface and the abrasive undergo a chemical or structural change which effects wear. With silicon carbide, silicon volatilizes leaving behind a pseudo-graphitic surface and the surface of diamond is observed to graphitize.

A Geometrically Nonlinear Finite Element Shell Theory.
Ph.D. Thesis.
L. J. Ernst. 1981, 265p

A curved triangular thin, elastic finite shell element is presented with expressions for the deformation tensors in terms of cartesian displacement components. In deriving these expressions the element is considered and originally flat plate with initial curvature. Approximations are accepted in the specification of the element geometry. Consequently the expressions for the deformation tensors are approximations are provided. An important parameter used in the error estimates is the maximum slope, theta, of middle surface of the element with respect to its basic triangle. This parameter vanished with continuously decreasing linear dimensions of the elements. Approximate deformation tensors are derived both in terms of displacement components with respect to the original reference position and with respect to a special reference position. The latter description is especially suitable for caes with arbitrary large displacements and rotations, since a possible rigid body motion of the element is separated from the displacement pattern.

Theoretical, experimental and numerical analyses of thick isotropic homogeneous plates under different loading conditions are presented. The theory takes into account the effects of transverse shear deformation. The analysis uses a variational theorem, having the longitudinal displacements, the transverse shear stresses and the transverse normal stress as variables. The displacement and stress fields are expressed as finite series. Each term of these series is the product of two functions: the first is a given function of the normal transverse variable and the second is an unknown function of the middle plane variables. These expressions are handled as a functional. The third equation of equilibrium and the boundary conditions on the upper and lower surfaces of the plate are satisfied by introducing a Lagrange multiplier which has the significance of a generalized deflection. A complete system of partial differential equations and boundary conditions is sufficient to determine all the unknown functions results.

Progress Report.

Contract NAS1-16365

The energy dissipated by viscosity at the edge of a vibrating flat plate is calculated and compared to the radiated acoustic energy. A correction to the Kirchhoff integral estimate of the noise is derived. For Helmholtz number of order unity and smaller the dissipation can be comparable to or greater than the acoustic energy. A viscous compressible theory of the load distribution on a vibrating two dimensional body is developed. First it is shown that load calculations based on potential theory and the Newmann uniqueness condition (continuity of potential or pressure on the surface) are not in agreement with experiment or the more correct viscous theory. For a flat plate airfoil the eigensolution of potential theory is indeterminant while viscous theory yields a unique solution that has square root singularities at the edges. It is also shown that for compact surfaces the far field acoustics depend only on the magnitude of the eigensolutions of potential theoy and so will be uniquely determined by the viscous theory. It is suggested that the general viscous theory of vibrating surfaces with cross sectional geometry will lead to results in agreement with expermentally measured load distributions.

Further studies revealed the same behavior in other implants. This phenomenon was observed when an n-type dopant was implanted into a p-type matrix, or vice versa. However, some exceptions arose, making the interpretation difficult. The use of matrix signal normalization was adopted and found to improve the results. (Author)

Single crystal samples of phosphorus doped Hg sub 0.8 Cd sub 0.2 Te were annealed at temperatures varying from 450 C to 600 C in various Hg atmospheres. The samples were quenched to room temperature from the annealing temperatures. Hall effect and mobility measurements were performed at 77 K on all these samples. The results indicate the crystals to be p type for a total phosphorus concentration of 10 to the 19th power/cu cm in all the samples. The hole concentration at 77 K increases with increasing Hg pressures at 450 C and 500 C contrary to the observation in undoped crystals. Also, at low Hg pressures the concentration of holes in the phosphorus doped crystals is lower than in the undoped crystals. The hole concentration in all the samples is lower than the intrinsic carrier concentration at the annealing temperatures. The hole mobility in the doped crystals is similar to that in the undoped crystals. A defect model according to which phosphorus behaves as a single acceptor interstitially, occupying Te lattice sites while it acts as a single donor occupying Hg lattice sites was established. Equilibrum constants established for the incorporation of all the phosphorus species explain the experimental results

Semiconductor structures of GaAs-AlAs multilayers were developed for fundamental research microwave technology and optoelectronics applications. Measuring and evaluation procedures for molecular beam epitaxy (MBE) layers and semiconductor diodes were elaborated. Two semiconductor structures were studied: (1) periodic p/n doping multilayer structures ('nipi' structures) in GaAs consisting of a periodic sequence of ultrathin alternating p and n-doped GaAs layers, possibly with intrinsic (i-) layers in between, and (2) one-sided abrupt GaAs/n+-AlXgAl-XAs heterostructures producing two-dimensional carrier confinement and enhanced mobilities at the interface. The method performs better than previous MBE technologies.

Elastic constants of polycrystalline copper are determined between 4 and 295 K by measuring ultrasonic velocities, longitudinal and transverse. Five elastic constants are given: longitudinal modulus, shear modulus, Young's modulus, bulk modulus (reciprocal compressibility), and Poisson's ratio. Considering eight theories of single-crystal:polycrystal elastic constants, the Hershey-Kroner-Eshelby theory agrees best with observation, within 1% for the shear modulus. A problem exists concerning the calculation of the Debye temperature of polycrystalline aggregates.

A summary is presented of modern experimental and theoretical treatments of electron spin polarization phenomena in low energy electron scattering from solids. Relativistic and exchange interactions are treated separately. The use of polarization measurements for surface structure determinations and the investigation of surface magnetism is emphasized. A total of 105 references are given.

The Superconductive Energy Gap of AuAl(2),
R. J. Soulen, Jr., D. Van Vechten, G. Costabile, Terrence Jach, and L. B. Holdeman. 1981, 2p
NASA Order-H-27908B
Pub. in Physica 108B, p823-824 1981.

Two hundred nm films of AuA2 were prepared. The superconductive transition determined by resistive measurements were found to vary from film to film, from 177 to 184 mK, and the transition widths varied between 6 and 15 mK. Film surfaces were oxidized by the Greiner process and Al counter electrodes were deposited in order to produce tunnel junctions. The temperature dependence of the energy gap of AuAl2 was measured and found to agree well with BCS theory.

This report summarizes our progress in a research program devoted to high resolution acoustic microscopy and cryogenic temperatures. During the past year we have studied the acoustic properties of two cryogenic fluids - liquid argon and liquid 4He below the temperature of 0.5 degrees K. In argon we have determined that nonlinear effects provide us with a dramatic increase in resolving power for focused acoustic beams. In liquid helium we have measured the attenuation versus temperature of sound at 1 GHz where the wavelength is less than 2500 A. The predicted behavior below 0.5 degrees K where the attenuation varies as the fourth power of temperature is confirmed for the first time at these small wavelengths. It gives us further confidence in our program to realize an instrument that will permit us to examine our specimens with an acoustic probe that is less than 1000 A in diameter.

Pub. in Cryogenics 21, n12 p697-703 Dec 81.

A correlation for the thermal conductivity of helium has been developed which covers the temperature range from temperatures just above the lambda line to 830K, and densities up to about 160/cu kgm. The data used incorporate some recent experimental results which cover the temperature range from 4K to 20K including the critical region. The correlation gives an equation which is probably correct to better than + or - 6%.

Extremely high frequency propagation data and meteorological measurements, including rain rate along the propagation path, windspeed and wind direction in the horizontal plane, the atmospheric temperature, pressure and humidity and raindrop size distribution are given for a vertically polarized Cassegrain antenna link. Actually measured raindrop size distribution and spherical raindrops, were used to measure the attenuation caused by rain using Mie's scattering theory for water spheres. It is noted that in fog, the attenuation is small for millimeter waves and high for infrared waves. Data are collected from point visibility meters, ombrometers and rapid response rain gages.

The effects of rain, snow, and wet snow on vertically and horizontally polarized Cassegrain antenna link 94 GHz waves are reported. Data were collected from point visibility meters, ombrometers, and rapid response rain gages. It is noted that water effect is the same in both cases. Rain effect is described by the calculated rain attenuation based on measured drop size distributions and spherical raindrops. Snow gives a slightly higher attenuation than rain at the same equivalent rain rate for vertical polarization.

Certain aspects of ignition source effects in reactive fuel-air mixtures are discussed. These aspects include effects of chemical sensitizers, flame acceleration, flame area, and ignition point location. The other area involves the hydrodynamic modeling of ignition and flamespreading in granular energetic solids to predict the potential for deflagration-to-detonation transition (DDT). Key results in the first area are that chemically sensitized clouds can lead to detonation, that flame acceleration or a large increase in the time rate of increase of the flame area are needed for transition from deflagration to detonation and that it is very difficult to generate damaging overpressure from edge-ignited combustion even for very high subsonic burning velocities. The research dealing with analysis of DDT in porous high energy solid propellant has shown (for the first time) actual steady-state detonation solutions, following the unsteady flow, for materials with sufficient porosity and critical burning rate properties. Limits of the run-up length to detonation are predicted as a function of propellant chemical energy, burning rate, bed porosity, and granulation (size). The detonation states conform to realistic measured conditions for porous HMX and RDX propellants.

This research project is concerned with determining the mechanisms governing the formation and combustion of metal/agglomerate/metal oxide particles throughout the solid rocket motor, that is, surface/near surface, cavity, and nozzle regions. Also of concern is the influence these particles have on propellant combustion characteristics and motor performance. The efforts of this past year were directed toward developing the experimental equipment needed for determining particle size distributions at and near the propellant surface. A solid propellant strand window bomb with a servo controlled positioning device was constructed and operated. Also, the interface of this equipment with data recording and reduction equipment was accomplished. The laser imaging device to be used to measure particle size distributions is undergoing calibration tests. (Author)

A plasma interaction analysis in support of the solar electric propulsion subsystem examined the effects of a large high voltage solar array interacting with an ion thruster produced plasma. Two solar array test modules consisting of 36 large area wraparound contact solar cells welded to a flexible Kapton integrated circuit substrate were abricated. The modules contained certain features of the effects of insulation, din-holes, and bonding of the cell to the substrate and a ground plane. The possibility of a significant power loss occurring due to the collection of charged particles on the solar array interconnects was the focus of the research.

Dependence on foreign oil sources and the attendant strategic problems of securing the long lines of supplies from possible interruption raise a question of the ability of the Armed Forces to carry out its mission in the event of a national emergency. Energy is essential for the Army in maintaining readiness to assure national security in peacetime, crisis, or war. The Army Energy Plan, which is in concert with and support of national energy goals, establishes the basis for reducing energy consumption, reducing dependency on conventional hydrocarbon fuels, and tasks the Army to obtain a position of energy leadership. In this report, the Department of Army Energy goals/objectives are identified and the framework for planning Army Mobility/Energy/Research and Development is outlined. Key elements of the Army Mobility Energy R and D plan of action include an organization plan, technical assessment, technical performance plan, and a management plan. The Army Mobility Energy R and D Program has been categorized into four program areas--fuels, other fluids, engines, and other equipment. Examples of individual projects, as well as an overview of the Army's Mobility Energy Research and Development are provided with respect to meeting Army Energy goals. (Author)

Harvey J. Clewell, III . Sep 80, 131p Rept no. AFESC/ESL-TR-80-56

An experimental and modeling effort was undertaken to determine the physical fate of JP-4 jet fuel discharged from an aircraft in flight. A computer model was developed to simulate evaporation and free-fall of fuel droplets in the atmosphere. In order to apply this model to jettisoned fuel, an experimental study was performed to determine the droplet size distribution produced by the jettisoning process. This study featured in-flight sampling of the fuel plume from a KC-135 tanker aircraft. Sampling was also performed at ground level to determine whether the jettisoned fuel reached the ground in significant concentrations. For fuel jettisoning as low as 750 meters above the ground at temperatures around 11 C, no liquid fuel could be detected by ground observers and no significant hydrocarbon concentrations (greater than a few ppm C) were measured by the sampling.

Effect of Heated Diesel Fuel on Particulate Generation and Fuel Consumption for a Deutz F6L 912W Engine.

Light diesel fuel (SG = 0.805) was employed in a dynamometer-coupled Deutz F6L 912W indirect injection diesel engine, in both a cold and a hot condition, in order to determine the effects of fuel temperature on fuel consumption and on the concentrations of CO and carbon particulate matter in the exhaust gases generated at near maximum load/speed operating conditions. Three test runs on three different days indicated that, for a given engine torque and speed, and fuel temperature increases from 75 exp 0 F/24 exp 0 C to 180 exp 0 F/83 exp 0 C: no significant, variation in fuel flow rate was observed; no significant overall variation in the generation of particulate matter was observed;

and a minor 12% reduction in the generation of CO was observed (i.e., 210 ppM to 185 ppM approximately). Consequently, it does not appear that this emissions reduction strategy is useful in underground applications where IDI engines are widely used. (ERA citation 07:004911)

Regional Analysis of Potential Energy Production from Agricultural Wastes: A Technical and Economic Study.
H. Have. Sep 79, 162p
U.S. Sales Only.

The possibilities for utilization of agricultural wastes for energy production are analyzed in two Danish counties, Ringkoebing and Vestsjaelland, which have different agricultural production patterns. The quantitative analysis shows that the major waste products, surplus straw, waste wood and animal waste, in total with present technique can cover about 28% of the demand for heat energy (mostly space heating) in both counties. The potential coverage from straw, wood and animal waste is about 3, 3 and 22% in Ringkoebing and 18, 2 and 8% in Vestsjaelland, respectively. A technical analysis indicates that direct combustion in the most favorable conversion method for straw and wood while biological conversion at present is best suited for animal waste. An economic analysis based on costs of collection, storage, transport and conversion of wastes and costs of corresponding oil and oil conversion were made. From a community point of view only straw and wood are found to be competitive to the expensive gas fuel oil when burned in automatically stoked furnaces. From a heating station point of view waste utilization is more attractive because of the sales tax on oil products. Here straw and wood are competitive fuels to both gas and heavy fuel oil in all the analyzed systems except from the small manually stoked furnaces. Animal waste seems to be competitive only when replacing gas fuel oil in medium size (500 kW) well utilized aerobic ferementeres. Apart from being economically attractive in many cases waste utilization for energy production also has positive effects on foreign payment balance, employment and supply safety. In addition it has advantages in reducing fire hazard by field burning of straw, sulphur pollution, odor emission and parasite infection from animal waste. (ERA citation 06:034988)

Determination of Tetraalkyllead Compounds in Gasoline by Liquid Chromatography--Atomic Absorption Spectrometry.
Final rept.,
J. D. Messman, and T. C. Rains. Sep 81, 5p
Pub. in Analytical Chemistry 53, n11 p1632-1636 Sep 81.

A liquid chromatography--atomic absorption spectrometry (LC-AAS) hybrid analytical technique is presented for metal speciation measurements on complex liquid samples. The versatility and inherent metal selectivity of the technique are illustrated by the rapid determination of five tetraalkyllead compounds in commercial gasoline. Separation of the individual tetraalkyllead species is achieved by reversed-phase liquid chromatography using an acetonitrile/water mobile phase. The effluent from the liquid chromatograph is introduced directly into the aspiration uptake capillary of the nebulizer of an air/acetylene flame atomic absorption spectrometer. Spectral interferences due to coeluting hydrocarbon matrix constituents were not observed at the 283.3 nm resonance line of lead used for analysis. Detection limits of this LC-AAS hybrid analytical technique, based on a 20-microliter injection, are approximately 10 ng Pb for each tetraalkyllead compound.

Analysis and flow experiments on a ceramic-coated-porous-metal vane concept indicated the feasibility, from a heat transfer standpoint, of operating in a high-temperature (1644 K; 2500 deg F) gas turbine cascade facility. The heat transfer and pressure drop calculations provided a basis for selecting the ceramic layer thickness (to 2.03 mm; 0.08 in.), which was found to be the dominant factor in the overall heat transfer coefficient. Also an approximate analysis of the heat transfer in the vane trailing edge revealed that with trailing-edge ejection the ceramic thickness could be reduced to 0.254 mm (0.01 in.) in this portion of the vane. The objectives of these efforts were to review the existing information on blade performance and wall effect prediction, and to extend this information by systematic application of numerical methods to representative geometries. In its performance period Working Group 12 had confined to axial turbomachines only and split into a Turbine Sub-Group and a Compressor Sub-Group. In the Turbine Sub-Group five correlations were reviewed and evaluated against the test cases. Each correlation had its strengths and weaknesses and room for further improvements. The Compressor Sub-Group report begins with a comprehensive survey of the various loss and deviation mechanisms. For comparison of the prediction methods to the test cases five authors have used their own correlations, while the sixth employed a single code in conjunction with three correlations for the four stage compressor. The results of the evaluation are similar to those of the Turbine Sub-Group, but the spanwise parameter distribution is often poorly predicted. This Advisory Report was prepared at the request of the Propulsion and Energetics Panel of AGARD.

Calculations show improved stator performance when the tip end wall was contoured so that the inlet area was greater than the exit area. Comparisons are made with previously published experimental data. The results of a parametric analysis of the effect contour geometry on the efficiency of a highly loaded axial stator are given. The maximum stator efficiency gain is about 0.8 percentage point, and this represents a 22 percent reduction in stator losses. The degree to which end-wall contouring reduces the forces driving secondary flows was also examined. The driving forces for both cross channel and radial secondary flow were reduced.

Low power emission levels were essentially identical while the high power NOx emission indexes were approximately 15% lower with the EBRS fuel. The exhaust smoke number was approximately 50% higher with ERBS at the takeoff thrust setting; however, both values were still below the EPA limit of 40 for the Model TFE731 engine. Primary zone liner wall temperature ran an average of 25 K higher with ERBS fuel than with Jet-A. The possible adoption of broadened proprties fuels for gas turbine applications is suggested.

Beginning with a casingless impeller with six backward curved blades, the influence of a small logarithmic volute casing with a cutoff clearance of delta/R = 0,014 (R = impeller radius) upon the flow through the rotating impeller ducts is studied. There was a blockage of the flow in each impeller duct when passing the cutoff, due to the small cutoff clearance. An optimization of the casing geometry regarding low noise and high fan efficiency leads to a logarithmic spiral with a large cutoff clearance of detla/R = 0,3. The noise is reduced by 22 dB (A) without loss in fan efficiency.

Metal fatigue under stress and thermal cycling is a principal mode of failure in gas turbine engine hot section components such as turbine blades and disks and combustor liners. Designing for fatigue is subject to considerable uncertainty, e.g., scatter in cycles to failure, available fatigue test data and operating environment data, uncertainties in the models used to predict stresses, etc. Methods of analyzing fatigue test data for probabilistic design purposes are summarized. The general strain life as well as homo- and hetero-scedastic models are considered. Modern probabilistic design theory is reviewed and examples are presented which illustrate application to reliability analysis of gas turbine engine components.

To Be Presented at the 15TH Ann. Simulation Symp., Tampa, Fla., 17-19 Mar. 1982.

The application of Predictor corrector integration algorithms developed for the digital parallel processing environment are investigated. The algorithms are implemented and evaluated through the use of a software simulator which provides an approximate representation of the parallel processing hardware. Test cases which focus on the use of the algorithms are presented and a specific application using a linear model of a turbofan engine is considered. Results are presented showing the effects of integration step size and the number of processors on simulation accuracy. Real time performance, interprocessor communication, and algorithm startup are also discussed.

Contract NAS8-33981

A supersonic diffuser ejector design computer program was developed. Using empirically modified one dimensional flow methods the diffuser ejector geometry is specified by the code. The design code results for calculations up to the end of the diffuser second throat were verified. Diffuser requirements for sea level testing of high expansion ratio space engines were defined. The feasibility of an ejector system using two commonly available turbojet engines feeding two variable area ratio ejectors was demonstrated.

Parametric Study of Propellant Crack Combustion.
Final rept. for FY1979,
Kibong Kim. 21 Oct 81, 37p Rept no. NSWC/TR-79-485

Selective calculations have been made for burning in cracks as it pertains to solid rocket motor propellants. The possibility of obtaining pressures high enough to cause a shock-to-detonation transition (sdt) in propellant grains is examined. variables affecting the crack combustion process which were selected for study are: crack shape; location; surface roughness; propellant deformation; ignition criterion; and burning rate. The variables are evaluated and ordered in groups of relative importance. results suggest that SDT should not occur in propellants unless the granulation of the grain is severe enough to provide large burning surface area. Ranging and Synchronization between Nominally Co-Orbital Satellites.
Interim rept.,
J. W. Schwartz. 24 Dec 81, 16p Rept no. NRL-8532

A link between two satellites can provide direct measurements of clock synchronism and intersatellite range that are more accurate than estimates obtainable from ground measurements. Moreover these direct measurements can be made continuously with near-zero delays. Two approaches to ranging and synchronization between satellite pairs are 'balanced' systems in which each satellite makes a time-difference measurement, and 'full loop' systems in which a time-difference measurement is made on only one satellite. This report discusses factors which determine the ultimate limitations and capabilities of both approaches, and compares the schemes for applications in which two digital clocks are actually brought into synchronism with accuracies of several nanoseconds. This workbook is designed for students interested in space flight planning, who after training, may serve as flight planning aides. Routine flight planning activities requiring engineering-type calculations and analysis are covered. Practice exercises and brief instructions are given for the programming and use of the hand calculator as well as the calculation of position and velocity in the orbital plane. Calculation of relative orbital position is also covered with emphasis upon celestial coordinates and time measurement.

The research documented in this report addresses several major technical issues in vibration controller design methodologies that are of fundamental importance to control of large flexible space structures. Fundamentally important analytical and numerical results, as well as useful new insights, have been obtained on: optimality of fixed-form reduced-order compensators; full-order closed-loop stability and robustness with reduced-order controllers; prevention of control and observation spillover; active augmentation of damping, stiffness, and stability, stabilizability by output feedback control; large-angle maneuver with simultaneous vibration suppression; and possibilities for improving current controller design methodologies.

Prepared in cooperation with ARO, Inc., Tullahoma, TN.

Tests were conducted in a hypervelocity track facility to establish the ablative characteristics of the heatshield material for the NASA/Ames Galileo Probe. Data were obtained from eight shots at launch velocities ranging from 15,850 fps to 17,950 fps. Six of the shots were conducted through an argon environment. The test required the nosetip to be recovered intact. Measurements were made of the model velocity and in-flight surface temperature. A description of the test unit, test article, and test technique is presented herein. (Author)

Space shuttle, the most complex transportation system designed to date, illustrates the requirement for an analysis approach that considers all major disciplines simultaneously. Its unique cross coupling and high sensitivity to aerodynamic uncertainties and high performance requirements dictated a less conservative approach than those taken in programs. Analyses performed for the space shuttle and certain payloads, Space Telescope and Spacelab, are used a examples. These illustrate the requirements for system analysis approaches and criteria, including dynamic modeling requirements, test requirements control requirements and the resulting design verification approaches. A survey of the problem, potential approaches available as solutions, implications for future systems, and projected technology development areas are addressed.

A proposal for a climate research mission specialized to Earth radiation budget measurements is given. This mission requires daily global coverage established by a system of three orbiting satellites. One of them is represented by the European Space Agency satellite SEOCS that is on a drifting orbit with respect to the Sun with 57 degrees inclination. The two others are polar orbiting satellites (POMS). The mission concept is treated with reference to the payload side requirements, the choice of orbit, orbital analysis, and satellite requirements.

Program plans are established for a storable propellant space tug used to perform high energy orbit transfers from the space transportation system (STS) orbiter. The mission model for the STS in the 1980's is analyzed. Performance and mission requirements are determined. Various flight operations modes are evaluated and selected. Subsystems are selected and synthesized into various tug configurations. Program options for these configurations are defined, analyzed, and selected. Selected program options are further defined and optimized, including program requirements, tug vehicle definition, mission accomplishment, ground and flight operations, programmatics and costs.

Possible storable propellant configurations and program plans are evaluated for the space tug. Alternatives examined include: use of existing expendable stages modified for use with shuttle, followed by a space tug at a later date; use of a modified growth version of existing expendable stages for greater performance and potential reuse, followed by a space tug at a later date; use of a low development cost, reusable, interim space tug available at shuttle initial operational capability (IOC) that could be evolved to greater system capabilities at a later date; and use a direct developed tug with maximum potential to be available at some specified time after space shuttle IOC. The capability options were narrowed down to three final options for detailed program definition.

An interactive computer aided design program used to perform systems level design and analysis of large spacecraft concepts is presented. Emphasis is on rapid design, analysis of integrated spacecraft, and automatic spacecraft modeling for lattice structures. Capabilities and performance of multidiscipline applications modules, the executive and data management software, and grahics display features are reviewed. A single user at an interactive terminal create, design, analyze, and conduct parametric studies of Earth orbiting spacecraft with relative ease. Data generated in the design, analysis, and performance evaluation of an Earth-orbiting large diameter antenna satellite are used to illustrate current capabilities. Computer run time statistics for the individual modules quantify the speed at which modeling, analysis, and design evaluation of integrated spacecraft concepts is accomplished in a user interactive computing environment.

Thermal and Aerothermal Performance of a Titanium Multiwall Thermal Protection System.
D. E. Avery, J. L. Shideler, and R. N. Stuckey. Dec 81, 59p NASA-TP-1961, L-14719

A metallic thermal protection system (TPS) concept the multiwall designed for temperature and pressure at Shuttle body point 3140 where the maximum surface temperature is approximately 811 K was tested to evaluate thermal performance and structural integrity. A two tile model of titanium multiwall and a model consisting of a low temperature reusable surface insulation (LRSI) tiles were exposed to 25 simulated thermal and pressure Shuttle entry missions. The two systems performed the same, and neither system deteriorated during the tests. It is indicated that redesign of the multiwall tiles reduces tile thickness and/or weight. A nine tile model of titanium multiwal was tested for radiant heating and aerothermodynamics. Minor design changes that improve structural integrity without having a significant impact on the thermal protection ability of the titanium multiwall TPS are identified. The capability of a titanium multiwall thermal protection system to protect an aluminum surface during a Shuttle type entry trajectory at locations on the vehicle where the maximum surface temperature is below 811 K is demonstrated.

In German; English Summary. Sponsored by Bundesministerium fuer Forschung und Technologie.

The suitability of three European satellite platforms (ERDSAT, SPAS, SPOT) for a combined satellite system (remote sensing and Earth-oriented research) is discussed. The system consists of two Sun-synchronous orbiting satellites with a combined remote sensing and Earth-oriented research payload and of a pure climatography satellite on a drift orbit. All platforms can accommodate the basic payload, but SPAS offers some advantages and is the only platform able to accommodate the extended payload. The combined three-satellite system offers cost advantages over the four-satellite system only if the space shuttle is used as launcher. Hence, SPAS should be given preference over the other platforms for such a system. The subsystem design is presented and problem areas are discussed. Data acquisition and data processing of image and climatic data are the bottlenecks in existing systems.

Details of all satellites launched into orbit about the Earth have been published in The RAE Table of Earth Satellites, 1957-1980 (Macmillan Press, 1981). The

present report offers a similar listing, though in a different format, of all space vehicles that escaped from the Earth's influence as a result of the 109 space launchings during the years 1958-1980. Whenever possible, the following details are given for each component: name, international designation, date of launch, mass, basic shape and size, details of orbit or trajectory, and, where appropriate, the time and place or impact or landing on the Moon or a planet. The table is in six sections: (A) orbits around the Sun; (B) in the Earth-Moon system; (C) and (D) around the Moon; (E) around Mars; and (F) around Venus. (Author)

Tools used in the measurement of satellite attitude are described. Attention is given to the elements that characterize an attitude sensor, the references employed (stars, moon, Sun, Earth, magnetic fields, etc.), and the detectors (optical, magnetic, and inertial). Several examples of attitude sensors are described, including sun sensors, star sensors, earth sensors, triaxial magnetometers, and gyrometers. Finally, sensor combinations that make it possible to determine a complete attitude are considered; the SPOT attitude measurement system and a combined CCD star sensor-gyrometer system are discussed.

PION-DEUTERON INTERACTIONS
Experimental Study of the pi exp + - Interaction with Protons and Deuterons at Low Energy.
CEA-CONF-5254 1810

Double Scattering Processes in pi exp - D Interactions at 21 GeV/C.
INP-1053/PH 1815

PION MINUS-PROTON INTERACTIONS
Vector Meson Production in Pp, Anti Pp, pi exp + - p and K exp + - p Collisions and Comparison with the Quark Fusion Model.
HU-P-178 1813

Study on Dimensions of the Region of Secondary Negative Pion Emission in pi exp - p, pi exp - N and pi exp - C Interactions at 40 GeV/C.
JINR-R-1-80-593 1822

PION MINUS REACTIONS
Proton Multiplicity Distributions in Pion-Xenon Nucleus Collisions at 3.5 GeV/C.
JINR-E-1-80-39 1819

Elastic Scattering and Charge-Exchange of Pions by exp 3 He at the Intermediate Energies.
JINR-E-2-80-219 1819

Application of the Approximate Four Body Equations to Description of the Elastic Scattering and Charge Exchange of Pions by exp 3 He Nucleus.
JINR-E-4-13030 1821

Double Charge Exchange Reactions of Negative Pions on Nuclei with Changing Strangeness.
JINR-R-1-80-15 1821

Two-Particle Correlations Between Secondary Protons in the pi exp -12 C Interactions at 40 GeV/C.
JINR-R-1-80-55 1822

PION-NEUTRON INTERACTIONS
Amplitude Analysis in pi exp + N Implies pi exp + pi exp - p and K exp + N Implies K exp + pi exp - p Reactions at 6 GeV/C.
CEA-CONF-5216 1810

Measurement of the Reactions K exp + N Implies K exp + pi exp - p and pi exp + N Implies pi exp + pi exp - p at 6 and 12 GeV/C on a Transversely Polarized Deuteron Target.
CEA-CONF-5217 1810

PION-NUCLEON INTERACTIONS
Amplitude Analysis of pi N Scattering in Impact Parameter Representation.
EFI-381(39)-79 1812

On-Shell Baryon-Baryon Semi-Local Duality Relations.
IPNO-TH-80-26 1817

Global Structure of the General Solution of the Chew-Low Equations.
JINR-R-2-80-436 1822

PION-PION INTERACTIONS
Study on the pi p and pi pi Interactions in the 2-Prong Events of the pi exp + p Reaction at Psub(Pi Sup(+))= 3.05 GeV/C.
IAE-3241/1 1813

PION PLUS-PROTON INTERACTIONS
Experimental Study of the pi exp + - Interaction with Protons and Deuterons at Low Energy.
CEA-CONF-5254 1810

Vector Meson Production in Pp, Anti Pp, pi exp + - p and K exp + - p Collisions and Comparison with the Quark Fusion Model.
HU-P-178 1813

Study on the pi p and pi pi Interactions in the 2-Prong Events of the pi exp + p Reaction at Psub(Pi Sup(+))= 3.05 GeV/C.
IAE-3241/1 1813

PION PLUS REACTIONS
Angular Momentum Selection Rule and the exp 9 Be(Pi exp + ,p) exp 8 Be Reaction at 50 MeV.
IPNO-PhN-80-05 1816

Elastic Scattering and Charge-Exchange of Pions by exp 3 He at the Intermediate Energies.
JINR-E-2-80-219 1819

Application of the Approximate Four Body Equations to Description of the Elastic Scattering and Charge Exchange of Pions by exp 3 He Nucleus.
JINR-E-4-13030 1821

PION-PROTON INTERACTIONS
Average Charged Particle Multiplicities in Pp, pi p and E exp + E exp - Interactions.
RL-80-046 1827

PION REACTIONS
Differences Between Some Characteristics of Slow Particles Produced in Interactions of Pions and Protons with Nuclei at High Energies.
INP-1050/PH 1815

Study of Low-Energy Pion-Deuteron Scattering in the Method of Evolution with Respect to Coupling Constant.
JINR-E-4-80-28 1821

Calculation of the Low-Energy Characteristics of Pion Scattering on exp 3 He and exp 4 He Nuclei.
JINR-R-4-12793 1824

Isospin Effects in Pion-Nuclear Scattering.
UM-P-80/65 1831

PIONEER LAKE DAM
National Dam Inspection Program. Pioneer Lake Dam (NDI ID Number PA-431, DER ID Number 32-80), Susquehanna River Basin, Offstream, Hazelet Run, Indiana County, Pennsylvania. Phase I Inspection Report,
AD-A108 952/3 1757

PIONS
Massive Neutrinos, the Goldberger - Treiman Relation, and the pi Implies E nu Branching Ratio.
UM-P-80/47 1830

PIONS PLUS
Pi exp + -Meson Production in Low-Energy Proton Collisions with Carbon and Copper Nuclei.
JINR-1-80-294 1825

PIPE FLOW
Prediction of the Hydraulic Jump Location Following a Change of Slope in a Partially Filled Drainage Pipe,
PB82-142134 1767

PIPE JOINTS
Flexible Joints for Gravity Sewers.
PB82-151507 1778

AD-A108 870/7 1833

Optical Properties of the Surface Plasmon of n(+) Silicon.
AD-A109 401/0 1834

Prompt gamma -Ray Spectra and Integrated Cross Sections for the Radiative Capture of 14 MeV Neutrons for 28 Natural Targets in the Mass Region from 12 to 208.
INDC(YUG)-6/L 1815

Flat-Plate Solar Array Project. Task 1: Silicon Material: Investigation of the Hydrochlorination of SIC1SUB4.
N82-14631/7 1743

Kinetics Studies on the Nucleation and Growth of Silicon Via Chemical Vapour Deposition.
N82-14939/4 1802

SILICON 28

Inelastic Scattering of exp 9 Be Projectiles to Low Lying Collective States in exp 28 Si and exp 40 Ca at E(exp 9 Be) = 45 and 60 MeV.
ANU-P-758 1810

Static Quadrupole Moment of the First Excited State of exp 28 Si.
ANU-P-759 1810

Comparison of Spectroscopic Models of Low Excitation 2 exp + States in exp 24 Mg and exp 28 Si Using Inelastic Proton Scattering.
UM-P-78/81 1829

SILICON 28 TARGET

Measurement of the Total Fusion Cross Section for the exp 9 Be + exp 28 Si System.
ANU-P-752 1809

Inelastic Scattering of exp 9 Be Projectiles to Low Lying Collective States in exp 28 Si and exp 40 Ca at E(exp 9 Be) = 45 and 60 MeV.
ANU-P-758 1810

First Study of the (Exp 14 C, exp 12 C) Reaction. Selectivity of This Reaction and the Energy Levels.
IPNO-PhN-80-15 1816

Isospin Effects in Pion-Nuclear Scattering.
UM-P-80/65 1831

SILICON 29 TARGET

Photoneutron Cross Section of exp 29 Si.
UM-P-80/68 1831

SILICON CARBIDES

Bending Fatigue Tests on Sic-al Tapes under Alternating Stress at Room Temperature.
N82-14285/2 1746

Preparation of Sinter Active Silicon Carbide Powders.
N82-14302/5 1745

Ultrasonic Velocity for Estimating Density of Structural Ceramics.

SILICON COMPOUNDS

Silicon Dew-Point Sensor for Accurate Humidity Measurement Systems.
N82-14493/2 1667

SILICON CONTROLLED RECTIFIERS

Silicon Controlled Rectifiers. 1975-February, 1982 (Citations from the International Information Service for the Physics and Engineering Communities Data Base).
PB82-861519 1733

SILICON DIOXIDE

Surface Modification in Control SiO2 Fiber Fracture.
AD-A108 796/4 1745

New Mexico Highway Department Crusher Study.
PB82-151788 1705

An Experimental Project to Determine the Parameters of Silica Scaling in Reverse Osmosis Systems.
PB82-157942 1724

SILICON NITRIDES

Surface-Strengthening Mechanisms in Reaction-Bonded Si sub 3 N sub 4 and Subcritical Crack-Growth Behavior in Ceramics.
AD-A109 087/7 1745

Processing Research on Chemically Vapor Deposited Silicon Nitride.
AD-A109 204/8 1745

Effect of the Powder Characteristics of SISUB3NSUB4 on the Microstructure of Sintered Bodies.
N82-14332/2 1745

SILICONES

Equilibrium Modulus of Model Poly(Dimethylsiloxane) Networks.
AD-A109 402/8 1750

Modulus of Three and Four Functional Poly(Dimethylsiloxane) Networks.
AD-A109 413/5 1750

Intrusive and Non-Intrusive Instruction in Dynamic Skill Training.
AD-A108 758/4 1675

SKY BRIGHTNESS

Airborne Measurements of Infrared Atmospheric Radiance and Sky Noise.
AD-A109 267/5 1665

SKY RADIATION

Spectral Atmospheric Observations at Nantucket Island, May 7-14, 1981.
N82-14550/9 1665

SKYSCRAPERS

Reduction of Overturning Potential of Seismically Excited Structures.
PB82-158494 1780

SLENDER BODIES

Performance Technology Program (PTP-S II). Volume V. Infrared Mapping of Boundary Layer Transition on a Slender Cone.
AD-A108 847/5 1786

SLENDER CONES

Hypersonic Slip-Flow around Slender Elliptical Cones at a Slight Angle of Attack.
N82-14069/0 1656

SLIDING FRICTION

Mechanisms for Transitional Friction and Wear Behavior of Sliding Metals,
PB82-153297 1749

SLIP FLOW

Hypersonic Slip-Flow around Slender Elliptical Cones at a Slight Angle of Attack.
N82-14069/0 1656

SLOW NEUTRONS

Study on the Self-Diffusion in Water by the Slow Neutron Quasi-Elastic Scattering Method. Pt.1. Experiment and Preliminary Data Processing.
FEI-965 1797

Study of the Atomic Motion in Methanol by Slow Neutron Scattering.
IEA-DT-156 1719

Focussing of Slow Neutrons with Cylindrical Zone Plates.
UM-P-81/14 1798

SMALL BUSINESSES

Minority Business Development Agency Task Force Report on The Impact of Enterprise Zones on Small and Minority Business.
PB82-155060 1673

SMALL PERTURBATION FLOW

Time Linearized Calculation of Two Dimensional Unsteady Transonic Potential Flow at Small Disturbances.
N82-14070/8 1656

SMELTERS

Respiratory Morbidity in Smelter Workers Study.
PB82-151820 1712

SMOG

Investigation of the Role of Natural Hydrocarbons in Photochemical Smog Formation in California.
PB82-146309 1768

SNOHOMISH RIVER

Snohomish Estuary Wetlands Study. Volume I. Summary Report,
AD-A109 391/3 1766

SNOW

Snowfall Rate Obtained from Radar Reflectivity within a 50KM Range.
AD-A109 010/9 1666

ITA-82-02-502 1672

SPRAY NOZZLES

Helicopter Icing Spray System (HISS) Nozzle Improvement Evaluation.
AD-A109 405/1 1660

Controlled Overspray Spray Nozzle.
PATENT-4 300 723 1778

SPREAD SPECTRUM

Spread-Spectrum Devices Cater to New Systems.
AD-A108 921/8 1740

SPRING GROVE DAM

National Dam Inspection Program. Spring Grove Dam (NDI Number PA-01028, DER Number 67-004), Susquehanna River Basin, York County, Pennsylvania. Phase I Inspection Report,
AD-A108 968/9 1759

SPURIOUS EFFECTS

Method for Suppressing Thermally Induced Signals in Fiber Optic Interferometric Sensors.
PAT-APPL-6-297 605 1782

SQUAD LEVEL ORGANIZATIONS

Miles Training and Evaluation Test, USAREUR: Battalion Command Group Training.
AD-A109 192/5 1676

SQUID DEVICES

Modelling the Impedance of a Josephson-Junction Noise Thermometer,
PB82-152117 1783

STABILITY

An Examination of Stability Criteria for Iterative Numerical Schemes Used in Solving Differential Equations.
AD-A109 362/4 1753

Numerical Stability of an Explicit Finite Difference Scheme for the Solution of Transient Conduction in Composite Media.
N82-14476/7 1747

STAINLESS STEEL-316

Creep-Fatigue Behavior of Four Casts of Type 316 Stainless Steel.
ND-R-512(S) 1748

STAINLESS STEELS

Predicted Single-Crystal Elastic Constants of Stainless-Steel 316.
PB82-152679 1749

STANDARDS

Standards Development Status.
NUREG-0566-V1-N10 1671

A Review of Standards of Performance for New Stationary Sources - Coal Preparation Plants.
PB82-152851 1769

Bulk Gasoline Terminals - Background Information for Proposed Standards. (Draft Environmental Impact Statement).
PB82-152869 1769

STANFORD AVENUE STORMWATER POND

National Dam Inspection Program. Stanford Avenue Stormwater Retention Pond (NDI Number PA-01146, DER Number 6-467), Delaware River Basin, Tributary to Wyomissing Creek, Berks County, Pennsylvania. Phase I Inspection Report,
AD-A109 111/5 1761

STAR CATALOGS

A Comparison of the SAOC with the AGK3 Hemispherical Expansions.
AD-A109 186/7 1662

STAR EVOLUTION

Final Stages of Star Evolution and the Hydrodynamic Theory of Supernova Bursts. A Detailed Review.
ITEF-98(1980) 1663

STAR MODELS

Isothermal Cloud Contraction by the Increasing Outer Pressure.
ITF-80-61R 1664

STARS

A Comparison of the SAOC with the AGK3 Hemispherical Expansions.
AD-A109 186/7 1662

Longitude Determination by Two Different Stars Observed at the Same Altitude East and West of the Meridian,
AD-A109 329/3 1662

STARTER CULTURES

Bacterial Starter Cultures Used by the Dairy Industry. 1978-February, 1982 (Citations from the Information Retrieval, Ltd. Data Base).
PB82-862251 1707

STATE GOVERNMENT

Development of a Plan for an Upper Plains States Innovation Group.
PB82-138694 1670

An Evaluation of the Implementation of State Protection and Advocacy Systems for the Developmentally Disabled (Volume I).
PB82-153206 1698

Energy Policy and the Elderly. Minnesota's Elderly in the 1990's.
SHR-0007170 1684

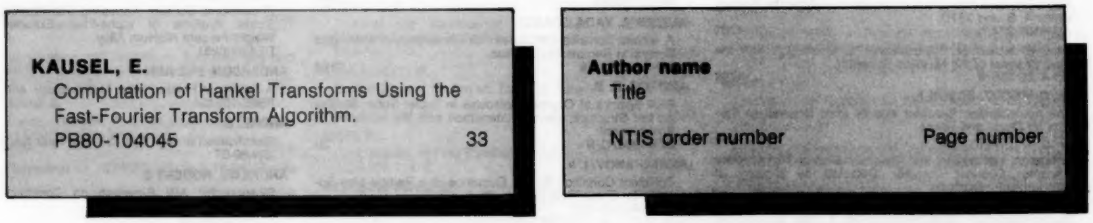
PERSONAL AUTHOR INDEX

NTIS®

This index is arranged by personal author's last name followed by either a first name or an initial. NASA and DoE reports do not spell out an author's first name, but use only initials. As many as five authors may be included for each citation; all are listed in this index.

SAMPLE ENTRY



AASTED, DONALD C.
Anchored Fish Aggregating Devices in Hawaiian Waters.
PB82-157694 1691

ABBAS, LEON E.
A Biological and Economic Analysis of the North Carolina Charter Boat Fishery.
PB82-157652 1691

ABBOT, R. H.
An Aerial Survey of Water Turbidity and Laser Depth Sounding Performance Along the Queensland Coast.
AD-A109 050/5 1731

ABBOTT, FRANK R.
Electro-Ceramic Stack.
PAT-APPL-6-226 668 1733

ABDEL-HAMID, TAREK K.
A Study of the Multicache-Consistency Problem in Multiprocessor Computer Systems.
AD-A109 134/7 1736

ABDURAKHIMOV, A. U.
Projectile Fragmentation Processes in exp 4 He-Nucleus Interactions at 4.5 GeV/C Per Incident Nucleon.
JINR-E-1-12730 1819

ABOU-SAYED, I. S.
The Numerical Simulation of Crack Growth in Weld-Induced Residual Stress Fields.
AD-A109 321/0 1747

ADAMS, A. M.
Hypervelocity Track Tests of the NASA Galileo Probe Heatshield.
AD-A109 042/2 1838

ADAMS, ARLON T.
The Response of a Two-Wire Transmission Line to Incident Field and Voltage Excitation, Including the Effects of Higher Order Modes.
AD-A108 780/8 1733

ADAMS, D. F.
Analysis of Crack Propagation as an Energy Absorption Mechanism in Metal Matrix Composites.
N82-14288/6 1747

ADAMS, DONALD F.
Moisture and Thermal Expansion of Composite Materials.
AD-A109 131/3 1746

ADRIAN, DONALD J.
Frequency Generator with Digitally Controlled Phase Modulation.
PAT-APPL-6-200 728 1741

AFANAS'EV, G. N.
Energy Dissipation in Heavy-Ion Reactions in the Framework of the Potential Model.
JINR-R-4-12918 1824

AFSAR, M. N.
Impurity and Defect Characterization in Epitaxial GaAs, InP and the Ternary and Quaternary Compound Semiconductors.
AD-A109 052/1 1802

AGEEV, A. I.
Problems of Superconducting Magnet Cooling under Beam Induced Heating Conditions.
IFVE-OUNK-80-138 1808

AGGARWAL, R. L.
Nonlinear Absorption Due to Shallow Donors in Germanium at 10.6 Micrometers.
AD-A109 075/2 1833

AGNEW, D. C.
The Seismotectonics of Plate Boundaries.
N82-14690/3 1729

AGOSTINI, P.
Multiphoton Transitions in Continua.
CEA-CONF-5315 1719

AGUAYO, L. G.
The Ionic Channel of the Acetylcholine Receptor: Regulation by Sites Outside and Inside the Cell Membrane Which are Sensitive to Quaternary Ligands.
AD-A109 240/2 1709

AGUIRRE, MANUAL
Device for Controlling Settling of Pile-Driven Structures.
PB82-156704 1780

AHMAD, JALEES
The Development of a Dynamic Elastoplastic Finite Element Analysis for Fast Fracture Under Impact Loading.
AD-A109 323/6 1748

Finite Element Analysis of Dynamic Crack Propagation.
AD-A109 322/8 1832

The Numerical Simulation of Crack Growth in Weld-Induced Residual Stress Fields.
AD-A109 321/0 1747

AHMADJIAN, M.
CIRRIS--A Cryogenic Infrared (IR) Radiance Instrument for Shuttle.
AD-A109 348/3 1781

AIZATSKII, N. I.
To the Question on the Mechanism of Longitudinal Instability of Cyclic Electron Beam in Vacuum.
KFTI-79-14 1809

AKCASU, A. Z.
Dynamic Light Scattering of Dilute Polymer Solutions in the Nonasymptotic q Region.
PB82-149790 1721

AKCASU, A. ZIYA
Concentration Dependence of Diffusion Coefficient at Various Molecular Weights and Temperatures.
PB82-149204 1721

AKHABABYAN, N.
Study on Dimensions of the Region of Secondary Negative Pion Emission in pi exp - p, pi exp - N and pi exp - C Interactions at 40 GeV/C.
JINR-R-1-80-593 1822

Two-Particle Correlations Between Secondary Protons in the pi exp -12 C Interactions at 40 GeV/C.
JINR-R-1-80-55 1822

AKHMEDOV, G. M.
Energy Spectra of Prompt Fission Neutrons Emitted at Different Angles Relative to the Fragment Motion Direction.
FEI-970 1813

AKHUNDOV, A. A.
Contribution of Lepton Pair Electromagnetic Production to the Inclusive Cross Section of Deep Inelastic mu p Scattering.
JINR-R-2-12814 1822

Electromagnetic Trident Production in Deep-Inelastic mu N Scattering.
JINR-R-2-12440 1822

PERSONAL AUTHOR INDEX

AKIMOV, YU. K.

Large-Solid-Angle Scintillation Hodoscope-Spectrometer for Investigation of Reactions with Low Energy Pions.
JINR-13-80-36 1795

Pi exp + -Meson Production in Low-Energy Proton Collisions with Carbon and Copper Nuclei.
JINR-1-80-294 1825

Preamplifier for Multisection Liquid Argon Ionization Chamber.
JINR-R-13-80-618 1794

AKIN, T. ALLEN

A Re-Usable Code Generator for PRIME 50-Series Computers.
AD-A108 820/2 1735

AKSINENKO, V. D.

Projectile Fragmentation Processes in exp 4 He-Nucleus Interactions at 4.5 GeV/C Per Incident Nucleon.
JINR-E-1-12730 1819

ALBRECHCINSKI, THOMAS M.

Characterization of Tire Wear Particulates.
PB82-153586 1774

ALBUQUERQUE, E. X.

Anatoxin-a: A Novel, Potent Agonist at the Nicotinic Receptor.
AD-A109 355/8 1709

Detection of Nicotinic Cholinergic Transmission in Malapterurus electricus Electroplax.
AD-A109 232/9 1709

Differentiation of the Open and Closed States of the Ionic Channels of Nicotinic Acetylcholine Receptors by Tricyclic Antidepressants.
AD-A109 252/7 1688

Inhibition of Calcium-Dependent ATPase from Sarcoplasmic Reticulum by a New Class of Indolizidine Alkaloids, Pumiliotoxins A, B, and 251D.
AD-A109 234/5 1709

Sites of Action of Phencyclidine. II. Interaction with the Ionic Channel of the Nicotinic Receptor.
AD-A109 356/6 1709

ALBUQUERQUE, EDSON X.

The Acetylcholine Receptor and Its Ionic Channel as Targets for Drugs and Toxins.
AD-A109 150/3 1688

Activation, Inactivation, and Desensitization of Acetylcholine Receptor Channel Complex Detected by Binding of Perhydrohistrionicotoxin.
AD-A109 423/4 1688

Batrachotoxinin-A 20-alpha-Benzoate: A New Radioactive Ligand for Voltage Sensitive Sodium Channels.
AD-A109 416/8 1688

Elucidation of the Mechanism and Site of Action of Quinuclidinyl Benzilate (QNB) on the Electrical Excitability and Chemosensitivity of the Frog Sartorius Muscle.
AD-A109 238/6 1709

Interaction of Imipramine with the Ionic Channel of the Acetylcholine Receptor of Motor Endplate and Electric Organ.
AD-A109 230/3 1709

The Ionic Channel of the Acetylcholine Receptor: Regulation by Sites Outside and Inside the Cell Membrane Which are Sensitive to Quaternary Ligands.
AD-A109 240/2 1709

Nereistoxin Interaction with the Acetylcholine Receptor-Ionic Channel Complex.
AD-A109 246/9 1709

Phencyclidine Interactions with the Ionic Channel of the Acetylcholine Receptor and Electrogenic Membrane.
AD-A109 244/4 1709

Regulation of (3H) Perhydrohistrionicotoxin Binding to Torpedo ocellata Electroplax by Effectors of the Acetylcholine Receptor.
AD-A109 249/3 1709

Sites of Action of Phencyclidine. III. Interactions with Muscarinic Receptors.
AD-A109 245/1 1709

Sites of Action of Phencyclidine. 1. Effects on the Electrical Excitability and Chemosensitive Properties of the Neuromuscular Junction of Skeletal Muscle.
AD-A109 357/4 1709

Voltage- and Time-Dependent Actions of Piperocaine on the Ion Channel of the Acetylcholine Receptor.

NTIS®

In this index, the name of the company, university, or government agency that performed the research or prepared the report is listed. Entries are arranged first by the organization's name, then alphanumerically by the performing organization report or series number. If no report or series number is included, the subarrangement is by NTIS order number.

NTIS ORDER/REPORT NUMBER INDEX

NTIS®

Entries in this index list the NTIS order number, the performing organization report number, and the sponsoring organization report number, each in its own alphanumeric position. Although reports may be ordered using only the performing organization report number or the sponsoring organization report number, please use the NTIS order number to order items available from NTIS to ensure faster service. It is best to check the full bibliographic citation in the Reports Announcements section before ordering. Entries are arranged alphanumerically.

Foreign NTIS Cooperating Organizations

NTIS is represented in many countries around the world by local organizations. These representatives ensure NTIS clients in those countries of fast and efficient service when transacting business with NTIS. They offer the convenience of accepting payment in local currencies and, any order-related problem can also be resolved by them. These representatives may also serve as an additional channel for non-U.S. information acquisitions.

NTIS clients in the countries listed below should direct all orders and inquiries to these representatives.
